

Business Questions

Type 1: App's Telemetry

Focus: Monitoring internal resources, performance, and stability.

Audience: Development Team.

1. What is the distribution (percentage) of Android vs. iOS versions across our active user base?

- It's important for the development team to know which versions to optimize for and make decisions about backwards compatibility.

2. Which API endpoints have the highest average response latency (ms)?

- High latency directly impacts the quality of the app as perceived by users so identifying these bottlenecks helps to improve the user experience.

3. What is the total size (MB) of the application binary for the latest production release on the Play Store and App Store?

- We want to ensure the binary remains lightweight since students tend to have full phone storage and have to prioritize one app over another. If we keep the app small, we remove a barrier to entry.

Type 2: Direct User Experience (UX) Improvement

Focus: Improving daily interaction.

Audience: The User (Student/Landlord).

4. What percentage of landlords respond to a student's initial message within 24 hours?

- If we provide the user with an approximate response time, it can reduce anxiety and help the user manage expectations during their housing search time window.

5. For a student user browsing listings, which housing options are within a 1.5km radius of their specified campus?

- This solves the user's immediate needs for proximity to the university by using external data to give the user options.

6. How many recommended roommate matches progress from chat to a meetup or agreement stage?

- This helps the developers assess whether the recommendation system truly helps users in finding compatible roommates.

7. For a student actively searching for housing, how many days remain before their intended move-in date without a confirmed apartment or roommate?

- If the app were to show this to the user, we'd communicate a sense of urgency and help students manage their time window more effectively. (this could also be a push notification)

Type 3: Feature Analysis

Focus: Deciding on the implementation, removal, or update of features.

Audience: Business/Product Owners.

8. What is the ratio of users who complete the "Find a Roommate" onboarding flow versus the "Find a Place" onboarding flow?

- This helps the business decide about the implementation/priority of features. If there is a significant amount of users who want housing rather than roommates, the business can pivot resources to acquire more landlords rather than focusing on social features.

9. What is the Click-Through Rate (CTR) on "Suggested Matches" compared to the number of manual searches performed per active session?

- This validates if the suggested matches are either not useful or poorly designed and may need an update or removal.

10. Which landlord features have an interaction frequency of less than 1 use per month per active landlord?

- This identifies features that clutter the UI, making the app leaner and easier to maintain.

11. What percentage of students upgrade from the freemium interaction limit to the 30-day one-time access after reaching the daily interaction cap?

- This can help the business determine if the freemium limitations and the paid access model support the housing search flow effectively or they need to be adjusted

Type 4: Benefits from Data

Focus: Profit from third parties.

Audience: Third-party companies/Partners.

12. What is the density of student users per ZIP code based on verified listing addresses?

- This information can be sold to city planners or businesses to help them understand where the student population is concentrating.

13. What are the top 5 most frequently selected "Lifestyle Tags" (e.g., Vegan, Gamer, Night-owl) across the student user base?

- This helps the business understand how to take advantage of data with third parties.

14. What is the average listed monthly rent price per bedroom across different city neighborhoods?

- This lets the business sell market reports to real estate investors who want to know the going rate for student housing.

Type *: Mixed Nature

Focus: Multi-category impact (UX + Profit).

Audience: Users and Third Parties.

15. **Which price intervals (\$X to \$Y) have a "Session Duration" 20% higher than the average, and which neighborhoods do these listings belong to?**
16. **Which 5 neighborhoods have the highest ratio of "Inquiries sent" vs "Listings available"?**
